General Site Description

The project site is on parcel #11-30-101-002 in Section 30, Highland Township, Oakland County, MI 48380.

The subject site is bordered:

- On the west by a large, open parcel 6.10 acres in size zoned Lake & Village (LV).
- On the north by the West Highland Road (M-59) MDOT Right of Way.
- On the east by a single-family residential parcel, 0.75 acres in size, zoned LV.
- On the southeast by Pommore Drive
- And on the south by a single-family residential parcel, 0.85 acres in size, zoned LV.

The subject site is an occupied parcel of land consisting of an operational day care center along West Highland Road with a driveway, paved parking lot, playground, fence separating the driveway from the playground, and wooded area in the east. Sanitary and water services are provided by existing onsite septic and well systems. The existing septic field and reserve septic field is on the southwest side of the playground and the well is on the northern edge of the parking lot. Along the southeastern property bend lies Pommore Drive (See the Existing Conditions Plan). The front of the property is a flat lawn space and the eastern half of the property has a moderately wooded area. There is currently one existing paved commercial drive approach from the north end of the subject property leading to the unstriped parking lot and gravel parking area from W Highland Road (M-59).

Natural Features

The parcel is developed. As described earlier, the property includes a day care building, a paved parking lot, and a playground. The day care center and playground occupy approximately the western half of the site with the paved parking lot in the middle of the site. The remaining eastern half of the site is moderately wooded with a collection of trees.

The site slopes from the center outwardly at 1-3% in all directions. The northern side of the parcel slopes toward W Highland Road (M-59) with slopes increasing from 2% to 6-10%, western side slopes toward the adjacent parcel field from 1-2% to 5-10%, eastern side sloping toward the adjacent property from 2% to 3-5%, and southern side sloping toward Pommore Drive from 2-3% to 10-20%. The site generally drains from the center to the north onto W Highland Road (M-59) with the remaining drainage following the site slopes.

The NRCS soils on the whole property are Fox Sandy Loam at 1-6% slope which is consistent with the general character of the slopes on the site.

Storm Water Management

Storm water will be managed onsite with the creation of a new storm water sewer network. The new school building, parking lot, and some of the modified playground area will be captured in catch basins and directed to the new underground detention system with a restricted discharge to the W Highland Road (M-59) MDOT right-of-way storm ditch and culvert through an overflow control structure. Detailed construction plans will be reviewed by the Township Engineer and the Soil Erosion Control plans will be reviewed and permit issued by the Livingston County Drain Commissioners office prior to construction commencing. Ongoing/periodic soil erosion inspections will occur per County requirements to ensure soil erosion is managed proactively.

Impact on Surrounding Land Use

The proposed special use will conform to existing development patterns and will not negatively impact adjacent properties with added lighting, noise, or air pollution. The proposed project seeks to expand the business operation of School Bell Childcare with the creation of a new schoolhouse building. The site development will comply with Township Ordinances and will meet the current Township, County, and State engineering standards. There will be minimal impact on surrounding land uses or development patterns as there will be no change to these uses. Additional lighting will be designed to illuminate the new schoolhouse building and parking lot and will not impact the adjacent residential homes.

Impact on Public Facilities and Services

The proposed updates to the existing site will not add any additional burden on the fire and police services. Fire trucks will use the M-59 right-of-way to access the site in case of a fire on either side of the site with an additional access behind the site from Pommore Drive. No hydrant coverage exists on the site. Refuse vehicles will have access to the onsite dumpster located at the southern end of the driveway to collect the garbage. The use increases the maximum overall school population to 96 students and 13 staff.

Impact on Public Utilities

Storm water will be detained onsite via the use of an underground detention system. Overall runoff along the northern end of the site toward W Highland Road (M-59) will be reduced below existing conditions. The storm water will be discharged at the restricted rate to the MDOT right-of-way culvert and ditch instead of the existing uncontrolled condition. Detailed construction plans would be reviewed by the Township Engineer and a Soil Erosion Control permit would be reviewed and issued by the Oakland County Drain Commissioner. Water & sanitary services will continue to be provided using the existing well and the existing and proposed septic systems onsite.

Storage or Handling of any Hazardous Materials

No storing or handling of any bulk hazardous materials is expected for this development.

Impact on Traffic and Pedestrians

A Trip Generation summary has been completed using the ITE 10th Edition Volume 2 manual and is included on the plans. The number of students will increase from 50 to 96 and would generate a maximum AM peak total of 75 trips and PM peak total of 76 trips from the arrival to the departure of the site. The entryway will be enlarged to 24 feet wide in conformance with the driveway width requirement along W Highland Road (M-59).

Special Provisions

A special land use permit application will be submitted with the site plan.

NATURAL FEATURES AND STEWARDSHIP PLAN NARRATIVE

PROJECT INFORMATION:

SITE SIZE: 1.62 AC

STATUS: PARTIALLY DEVELOPMENT, MATURE TREES

NATURAL FEATURES IDENTIFICATION INCLUDING AN EXISTING TREE INVENTORY WERE COMPLETED DURING A SITE VISIT ON MARCH 8TH, 2024. THE SITE IS DEVELOPED AND INCLUDES A DAY CARE CENTER BUILDING, PLAYGROUND, PARKING LOT AND DRIVEWAY. THE DEVELOPED AREA IS SURROUNDED BY MATURE TREES INCLUDING A SMALL WOODLOT DIRECTLY TO THE EAST.

WETLANDS & FLOODPLAIN: THERE ARE NO WETLANDS OR FLOODPLAIN AREAS ON SITE. THE CLOSEST WETLAND AREAS BASED ON SOIL SURVEY AND AERIAL DATA ARE APPROXIMATELY 500-FEET WEST AND 650-FT SOUTH OF THE SITE. NORTH ORE CREEK IS APPROXIMATELY 1/2-MILE NORTH.

SOILS: ALL SOILS ON THE SITE ARE CLASSIFIED AS FOX SANDY LOAM (18B, 1-6% SLOPES) PER USDA NRCS SOIL SURVEY DATA. FOX SANDY LOAM IS GENERALLY HIGHLY PERMEABLE. THIS SOIL CLASSIFICATION CAN ALSO MEAN THAT IT HAS HIGHER EROSION POTENTIAL ON STEEPER SLOPES (>10%). THE SITE IS CONSISTENT WITH THE CLASSIFICATION, WITH LESS EROSION POTENTIAL, EXCEPT WHERE IT ABUTS POMMORE DRIVE WHERE TOPOGRAPHY HAS BEEN GRADED AT AN APPROXIMATELY 20% SLOPE WITHIN THE ROAD R.O.W.

TREES: ALL TREES LARGER THAN 6-IN DBH WERE INVENTORIED DURING THE SITE VISIT. THE INVENTORIED TREES ALONG WITH THEIR APPROXIMATE RELATIVE CANOPY SIZES ARE SHOWN ON THE PLAN AT LEFT AND THE LIST OF TREES INCLUDING TAG NUMBER, COMMON & BOTANICAL NAMES, SIZES, CONDITION AND NOTES, IS INCLUDED ON THIS SHEET. THE WEST SIDE OF THE SITE IS DOMINATED BY SEVERAL LARGE NORWAY SPRUCE (9-36-INCH DBH, AVG 20) WITH A FEW SMALLER NORWAY SPRUCE (8-9-INCH DBH) ON THE EAST SIDE OF THE EXISTING PLAYGROUND. THE EAST SIDE OF THE SITE IS UNDEVELOPED AND DOMINATED BY LARGE DECIDUOUS TREES, MANY MULTI-STEMMED AND IN POOR CONDITION INCLUDING RED OAK, BLACK WALNUT, RED MAPLE & PIGNUT HICKORY. SIZES RANGE FROM 6-INCH DBH THROUGH 19-INCH DBH. THERE IS (1) GOOD CONDITION LARGE RED OAK AT 43-INCH DBH (AT THE SOUTH END OF THE PARKING AREA) AND (1) GOOD CONDITION LARGE WHITE OAK AT 40-INCH DBH (IN THE HIGHLAND ROAD / M-59 R.O.W.).

THREATENED, ENDANGERED SPECIES: NONE WERE OBSERVED ON SITE DURING THE TIME OF THE SITE VISIT.

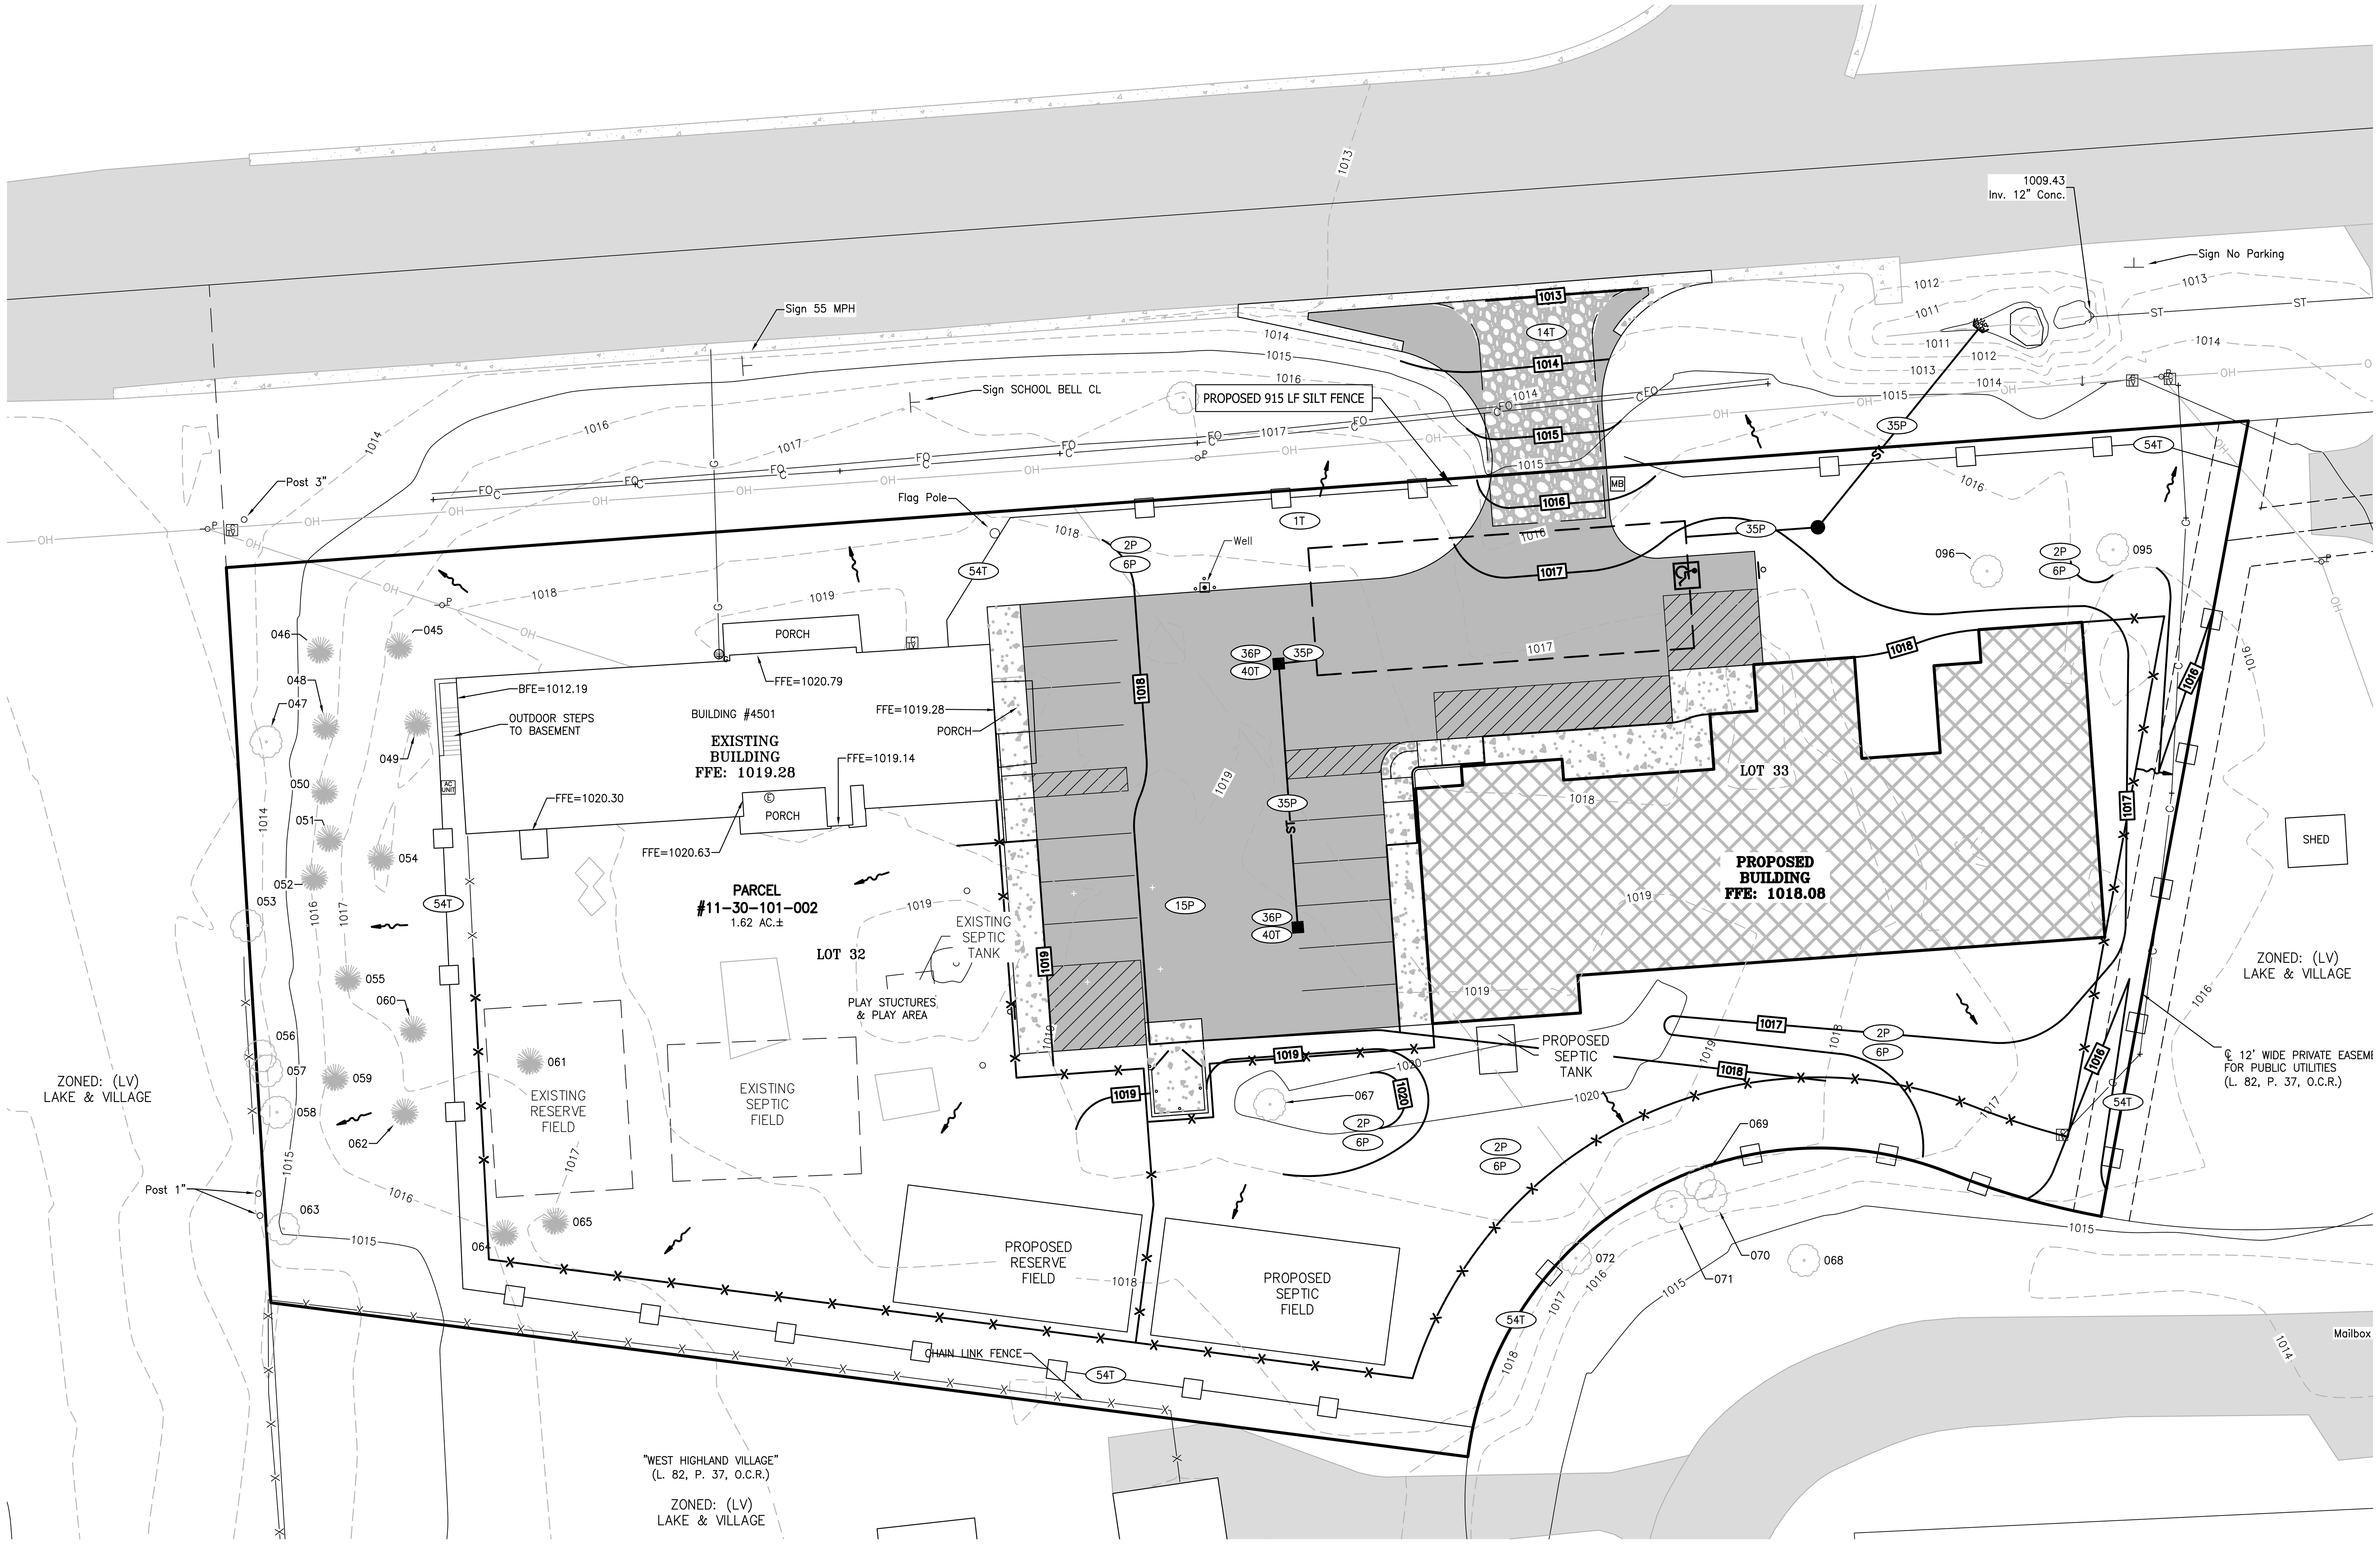
DEVELOPMENT: TWENTY-TWO (22) TREES ARE TO BE REMOVED FOR THE DEVELOPMENT OF THE SITE – ALL IN THE EAST, UNDEVELOPED AREA. NO TREES ARE TO BE RELOCATED. REMOVED TREES ARE WITHIN THE PROPOSED BUILDING OUTLINE AND WHERE IMPACTED BY THE EXPANDED PARKING LOT. MATURE TREES AROUND THE PERIMETER OF THE SITE WILL BE PRESERVED DURING CONSTRUCTION. PORTIONS OF THE EXISTING LOT AREA WILL BE UTILIZED FOR TOPSOIL STOCKPILING AND MATERIAL STAGING AREAS (AS NOTED ON THE PLAN).

SEE SHEET 2 FOR GENERAL NOTES AND LEGEND



SOIL EROSION CONTROL MEASURES

Symbol	No.	Measure	Description
1T	1	STRIPPING & STOCKPILING TOPSOIL	TOPSOIL MAY BE STOCKPILED ABOVE BORROW AREAS TO ACT AS A DIVERSION. STOCKPILE SHOULD BE TEMPORARILY SEEDED
2P	2	SELECTIVE GRADING & SHAPING	WATER CAN BE DIVERTED TO MINIMIZE EROSION. FLATTER SLOPES EASE EROSION PROBLEMS
6P	6	SEEDING WITH MULCH AND/OR MATTING	FACILITATES ESTABLISHMENT OF VEGETATIVE COVER. EFFECTIVE FOR DRAINAGEWAYS WITH LOW VELOCITY. EASILY PLACED IN SMALL QUANTITIES BY INEXPERIENCED PERSONNEL. SHOULD INCLUDE PREPARED TOPSOIL BED
14T	14	AGGREGATE COVER	STABILIZES SOIL SURFACE, THUS MINIMIZING EROSION. PERMITS CONSTRUCTION TRAFFIC IN ADVERSE WEATHER. MAY BE USED AS PART OF PERMANENT BASE CONSTRUCTION OF PAVED AREAS
15P	15	PAVING	PROTECTS AREAS WHICH CANNOT OTHERWISE BE PROTECTED, BUT INCREASES RUNOFF VELOCITY. IRREGULAR SURFACE WILL HELP SLOW VELOCITY
35P	35	STORM SEWER	SYSTEM REMOVES COLLECTED RUNOFF FROM SITE, PARTICULARLY FROM PAVED AREAS. CAN ACCEPT LARGE CONCENTRATIONS OF RUNOFF. CONDUCTS RUNOFF TO MUNICIPAL SEWER SYSTEM OR STABILIZED OUTFALL LOCATION. USE CATCH BASINS TO COLLECT SEDIMENT
36P	36	CATCH BASIN, DRAIN INLET	COLLECTS HIGH VELOCITY CONCENTRATED RUNOFF. MAY USE FILTER CLOTH OVER INLET
40T	40	INLET SEDIMENT FILTER	EASY TO SHAPE. COLLECTS SEDIMENT. MAY BE CLEANED AND EXPANDED AS NEEDED
54T	54	SILT FENCE	USES GEOTEXTILE FABRIC AND POST OR POLES. EASY TO CONSTRUCT AND LOCATE AS NECESSARY. (SEE DETAIL THIS SHEET)

INSTALLATION NOTES
1. WHEN PLACING THE FIRST LIFTS OF BACKFILL IT IS IMPORTANT TO MAKE SURE THAT THE BACKFILL IS PROPERLY COMPACTED UNDER AND AROUND THE PIPE HAUNCHES.
2. OTHER ALTERNATE BACKFILL MATERIAL MAY BE ALLOWED DEPENDING ON SITE SPECIFIC CONDITIONS, AS APPROVED BY SITE ENGINEER.
3. BACKFILL USING CONTROLLED LOW-STRENGTH MATERIAL (CLSM, "FLASH FILL" OR "FLOWABLE FILL") MAY BE USED WHEN THE SPACING BETWEEN THE PIPES WILL NOT ALLOW FOR PLACEMENT AND ADEQUATE COMPACTION OF THE BACKFILL. CONTACT CONTECH FOR FURTHER EVALUATION.
4. IF SALTING AGENTS FOR SNOW AND ICE REMOVAL ARE USED ON OR NEAR THE PROJECT, A GEOMEMBRANE BARRIER IS RECOMMENDED OVER THE UPPER HALF OF THE PIPE. THE GEOMEMBRANE LINER IS INTENDED TO HELP PROTECT THE SYSTEM FROM THE POTENTIAL ADVERSE EFFECTS THAT MAY RESULT FROM A CHANGE IN THE SURROUNDING ENVIRONMENT OVER A PERIOD OF TIME. PLEASE REFER TO THE CORRUGATED METAL PIPE DETENTION DESIGN GUIDE FOR ADDITIONAL INFORMATION.

126-144	3.5	4.0	4.5	4.5

*MINIMUM COVER MAY VARY, DEPENDING ON LOCAL CONDITIONS. THE CONTRACTOR MUST PROVIDE THE ADDITIONAL COVER REQUIRED TO AVOID DAMAGE TO THE PIPE. MINIMUM COVER IS MEASURED FROM THE TOP OF THE PIPE TO THE TOP OF THE MAINTAINED CONSTRUCTION ROADWAY SURFACE.

CMP DETENTION INSTALLATION GUIDE

PROPER INSTALLATION OF A FLEXIBLE UNDERGROUND DETENTION SYSTEM WILL ENSURE LONG-TERM PERFORMANCE. THE CONFIGURATION OF THESE SYSTEMS OFTEN REQUIRES SPECIAL CONSTRUCTION PRACTICES THAT DIFFER FROM CONVENTIONAL FLEXIBLE PIPE CONSTRUCTION. CONTECH ENGINEERED SOLUTIONS STRONGLY SUGGESTS SCHEDULING A PRE-CONSTRUCTION MEETING WITH YOUR LOCAL SALES ENGINEER TO DETERMINE IF ADDITIONAL MEASURES, NOT COVERED IN THIS GUIDE, ARE APPROPRIATE FOR YOUR SITE.

FOUNDATION

CONSTRUCT A FOUNDATION THAT CAN SUPPORT THE DESIGN LOADING APPLIED BY THE PIPE AND ADJACENT BACKFILL WEIGHT AS WELL AS MAINTAIN ITS INTEGRITY DURING CONSTRUCTION.

IF SOFT OR UNSUITABLE SOILS ARE ENCOUNTERED, REMOVE THE POOR SOILS DOWN TO A SUITABLE DEPTH AND THEN BUILD UP TO THE APPROPRIATE ELEVATION WITH A COMPETENT BACKFILL MATERIAL. THE STRUCTURAL FILL MATERIAL GRADATION SHOULD NOT ALLOW THE MIGRATION OF FINES, WHICH CAN CAUSE SETTLEMENT OF THE DETENTION SYSTEM OR PAVEMENT ABOVE. IF THE STRUCTURAL FILL MATERIAL IS NOT COMPATIBLE WITH THE UNDERLYING SOILS AN ENGINEERING FABRIC SHOULD BE USED AS A SEPARATOR. IN SOME CASES, USING A STIFF REINFORCING GEOGRID REDUCES OVER EXCAVATION AND REPLACEMENT FILL QUANTITIES.

GRADE THE FOUNDATION SUBGRADE TO A UNIFORM OR SLIGHTLY SLOPING GRADE. IF THE SUBGRADE IS CLAY OR RELATIVELY NON-POROUS AND THE CONSTRUCTION SEQUENCE WILL LAST FOR AN EXTENDED PERIOD OF TIME, IT IS BEST TO SLOPE THE GRADE TO ONE END OF THE SYSTEM. THIS WILL ALLOW EXCESS WATER TO DRAIN QUICKLY, PREVENTING SATURATION OF THE SUBGRADE.

GEOMEMBRANE BARRIER

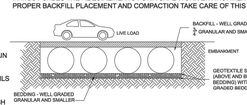
A SITE'S RESISTIVITY MAY CHANGE OVER TIME WHEN VARIOUS TYPES OF SALTING AGENTS ARE USED, SUCH AS ROAD SALTS FOR DEICING AGENTS. IF SALTING AGENTS ARE USED ON OR NEAR THE PROJECT SITE, A GEOMEMBRANE BARRIER IS RECOMMENDED WITH THE SYSTEM. THE GEOMEMBRANE LINER IS INTENDED TO HELP PROTECT THE SYSTEM FROM THE POTENTIAL ADVERSE EFFECTS THAT MAY RESULT FROM THE USE OF SUCH AGENTS INCLUDING PREMATURE CORROSION AND REDUCED ACTUAL SERVICE LIFE.

THE PREFERENCE OF RECORD IS TO EVALUATE WHETHER SALTING AGENTS WILL BE USED ON OR NEAR THE PROJECT SITE, AND USE HIS/HER BEST JUDGEMENT TO DETERMINE IF ANY ADDITIONAL PROTECTIVE MEASURES ARE REQUIRED. BELOW IS A TYPICAL DETAIL SHOWING THE PLACEMENT OF A GEOMEMBRANE BARRIER FOR PROJECTS WHERE SALTING AGENTS ARE USED ON OR NEAR THE PROJECT SITE.

IN-SITU TRENCH WALL

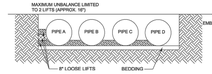
IF EXCAVATION IS REQUIRED, THE TRENCH WALL NEEDS TO BE CAPABLE OF SUPPORTING THE LOAD THAT THE PIPE SHEDS AS THE SYSTEM IS LOADED. IF SOILS ARE NOT CAPABLE OF SUPPORTING THESE LOADS, THE PIPE CAN DEFLECT. PERFORM A SIMPLE SOIL PRESSURE CHECK USING THE APPLIED LOADS TO DETERMINE THE LIMITS OF EXCAVATION BEYOND THE SPRING LINE OF THE OUTER MOST PIPES.

IN MOST CASES THE REQUIREMENTS FOR A SAFE WORK ENVIRONMENT AND PROPER BACKFILL PLACEMENT AND COMPACTION TAKE CARE OF THIS CONCERN.



BACKFILL PLACEMENT

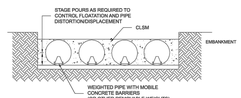
MATERIAL SHALL BE WORKED INTO THE PIPE HAUNCHES BY MEANS OF SHOVEL-SLICING, RODDING, AIR TAMPER, VIBRATORY ROD, OR OTHER EFFECTIVE METHODS.



IF AASHTO T99 PROCEDURES ARE DETERMINED INFEASIBLE BY THE GEOTECHNICAL ENGINEER OF RECORD, COMPACTION IS CONSIDERED ADEQUATE WHEN NO FURTHER YIELDING OF THE MATERIAL IS OBSERVED UNDER THE COMPACTOR, OR UNDER FOOT, AND THE GEOTECHNICAL ENGINEER OF RECORD (OR REPRESENTATIVE THEREOF) IS SATISFIED WITH THE LEVEL OF COMPACTION.

FOR LARGE SYSTEMS, CONVEYOR SYSTEMS, BACKHOES WITH LONG REACHES OR DRAGLINES WITH STONE BUCKETS MAY BE USED TO PLACE BACKFILL. ONCE MINIMUM COVER FOR CONSTRUCTION LOADING ACROSS THE ENTIRE WIDTH OF THE SYSTEM IS REACHED, ADVANCE THE EQUIPMENT TO THE END OF THE RECENTLY PLACED FILL, AND BEGIN THE SEQUENCE AGAIN UNTIL THE SYSTEM IS COMPLETELY BACKFILLED. THIS TYPE OF CONSTRUCTION SEQUENCE PROVIDES ROOM FOR STOCKPILED BACKFILL DIRECTLY BEHIND THE BACKHOE, AS WELL AS THE MOVEMENT OF CONSTRUCTION TRAFFIC. MATERIAL STOCKPILES ON TOP OF THE BACKFILLED DETENTION SYSTEM SHOULD BE LIMITED TO 8- TO 10-FEET HIGH AND MUST PROVIDE BALANCED LOADING ACROSS ALL BARRELS. TO DETERMINE THE PROPER COVER OVER THE PIPES TO ALLOW THE MOVEMENT OF CONSTRUCTION EQUIPMENT SEE TABLE 1, OR CONTACT YOUR LOCAL CONTECH SALES ENGINEER.

WHEN FLOWABLE FILL IS USED, YOU MUST PREVENT PIPE FLOATATION. TYPICALLY, SMALL LIFTS ARE PLACED BETWEEN THE PIPES AND THEN ALLOWED TO SET-UP PRIOR TO THE PLACEMENT OF THE NEXT LIFT. THE ALLOWABLE THICKNESS OF THE CLSM LIFT IS A FUNCTION OF A PROPER BALANCE BETWEEN THE UPLIFT FORCE OF THE CLSM, THE OPPOSING WEIGHT OF THE PIPE, AND THE EFFECT OF OTHER RESTRAINING MEASURES. THE PIPE CAN CARRY LIMITED FLUID PRESSURE WITHOUT PIPE DISTORTION OR DISPLACEMENT, WHICH ALSO AFFECTS THE CLSM LIFT THICKNESS. YOUR LOCAL CONTECH SALES ENGINEER CAN HELP DETERMINE THE PROPER LIFT THICKNESS.

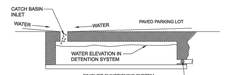


CONSTRUCTION LOADING

TYPICALLY, THE MINIMUM COVER SPECIFIED FOR A PROJECT ASSUMES H-20 LIVE LOAD. BECAUSE CONSTRUCTION LOADS OFTEN EXCEED DESIGN LIVE LOADS, INCREASED TEMPORARY MINIMUM COVER REQUIREMENTS ARE NECESSARY. SINCE CONSTRUCTION EQUIPMENT VARIES FROM JOB TO JOB, IT IS BEST TO ADDRESS EQUIPMENT SPECIFIC MINIMUM COVER REQUIREMENTS WITH YOUR LOCAL CONTECH SALES ENGINEER DURING YOUR PRE-CONSTRUCTION MEETING.

ADDITIONAL CONSIDERATIONS

BECAUSE MOST SYSTEMS ARE CONSTRUCTED BELOW-GRADE, RAINFALL CAN RAPIDLY FILL THE EXCAVATION, POTENTIALLY CAUSING FLOATATION AND MOVEMENT OF THE PREVIOUSLY PLACED PIPES. TO HELP MITIGATE POTENTIAL PROBLEMS, IT IS BEST TO START THE INSTALLATION AT THE DOWNSTREAM END WITH THE OUTLET ALREADY CONSTRUCTED TO ALLOW A ROUTE FOR THE WATER TO ESCAPE. TEMPORARY DIVERSION MEASURES MAY BE REQUIRED FOR HIGH FLOWS DUE TO THE RESTRICTED NATURE OF THE OUTLET PIPE.



CMP DETENTION SYSTEM INSPECTION AND MAINTENANCE

UNDERGROUND STORMWATER DETENTION AND INFILTRATION SYSTEMS MUST BE INSPECTED AND MAINTAINED AT REGULAR INTERVALS FOR PURPOSES OF PERFORMANCE AND LONGEVITY.

INSPECTION

INSPECTION IS THE KEY TO EFFECTIVE MAINTENANCE OF CMP DETENTION SYSTEMS AND IS EASILY PERFORMED. CONTECH RECOMMENDS ONGOING, ANNUAL INSPECTIONS. SITES WITH HIGH TRASH LOAD OR SMALL OUTLET CONTROL ORIFICES MAY NEED MORE FREQUENT INSPECTIONS. THE RATE AT WHICH THE SYSTEM COLLECTS POLLUTANTS WILL DEPEND MORE ON SITE SPECIFIC ACTIVITIES RATHER THAN THE SIZE OR CONFIGURATION OF THE SYSTEM.

INSPECTIONS SHOULD BE PERFORMED MORE OFTEN IN EQUIPMENT WASHDOWN AREAS, IN CLIMATES WHERE SANDING AND/OR SALTING OPERATIONS TAKE PLACE, AND IN OTHER VARIOUS INSTANCES IN WHICH ONE WOULD EXPECT HIGHER ACCUMULATIONS OF SEDIMENT OR ABRASIVE/CORROSIVE CONDITIONS. A RECORD OF EACH INSPECTION IS TO BE MAINTAINED FOR THE LIFE OF THE SYSTEM

MAINTENANCE

CMP DETENTION SYSTEMS SHOULD BE CLEANED WHEN AN INSPECTION REVEALS ACCUMULATED SEDIMENT OR TRASH IS CLOGGING THE DISCHARGE ORIFICE.

ACCUMULATED SEDIMENT AND TRASH CAN TYPICALLY BE EVACUATED THROUGH THE MANHOLE OVER THE OUTLET ORIFICE. IF MAINTENANCE IS NOT PERFORMED AS RECOMMENDED, SEDIMENT AND TRASH MAY ACCUMULATE IN FRONT OF THE OUTLET ORIFICE. MANHOLE COVERS SHOULD BE SECURELY SEATED FOLLOWING CLEANING ACTIVITIES. CONTECH SUGGESTS THAT ALL SYSTEMS BE DESIGNED WITH AN ACCESS/INSPECTION MANHOLE SITUATED AT OR NEAR THE INLET AND THE OUTLET ORIFICE. SHOULD IT BE NECESSARY TO GET INSIDE THE SYSTEM TO PERFORM MAINTENANCE ACTIVITIES, ALL APPROPRIATE PRECAUTIONS REGARDING CONFINED SPACE ENTRY AND OSHA REGULATIONS SHOULD BE FOLLOWED.

ANNUAL INSPECTIONS ARE BEST PRACTICE FOR ALL UNDERGROUND SYSTEMS. DURING THIS INSPECTION, IF EVIDENCE OF SALTING/DE-ICING AGENTS IS OBSERVED WITHIN THE SYSTEM, IT IS BEST PRACTICE FOR THE SYSTEM TO BE RINSED, INCLUDING ABOVE THE SPRING LINE SOON AFTER THE SPRING THAW AS PART OF THE MAINTENANCE PROGRAM FOR THE SYSTEM.

MAINTAINING AN UNDERGROUND DETENTION OR INFILTRATION SYSTEM IS EASIEST WHEN THERE IS NO FLOW ENTERING TH

SOD INLET FILTER (SI-1)
DEFINITION
SOD INLET FILTERS ARE PADS OF SOD PLACED AROUND A STORM DRAIN INLET OR CATCH BASIN.
PURPOSE
SOD INLET FILTERS ARE INSTALLED TO SLOW THE FLOW OF WATER INTO AN INLET OR CATCH BASIN AND TO FILTER OUT SEDIMENT IN THE PROCESS.
WHERE APPLICABLE
SOD INLET FILTERS SHOULD ONLY BE USED TO HANDLE LIGHT CONCENTRATIONS OF SEDIMENT. THEY ARE BEST USED AFTER FINAL GRADING IS COMPLETE AND DURING THE ESTABLISHMENT OF A VEGETATIVE COVER.

POLLUTANTS THAT COULD IMPAIR WATER QUALITY MAY INCLUDE FUEL, GREASE AND OIL, NUTRIENTS, BACTERIA AND PATHOGENS, LITTER AND DEBRIS, AND SOIL EROSION AND SEDIMENTATION. APPLICABLE BMPS SHALL BE IMPLEMENTED BY THE CONTRACTOR TO THE MAXIMUM EXTENT PRACTICABLE TO PROTECT WATER QUALITY AND WILDLIFE HABITAT.

Attention: Jared Prather

Reference: 4501 West Highland Road - Sub-Surface Exploration

Dear Mr. Prather,

Five (05) soil test borings designated as soil boring locations #1 through #5 were drilled in the influence of a planned new building located at 4501 West Highland Road in Highland Charter Township, Michigan. Soil test boring locations #1 and #5 were performed to determine the soil infiltration characteristics of the sub-surface sub-grade materials for a proposed underground detention system. Soil test borings #2 through #4 were performed in the influence of the proposed building to determine the structural integrity of the sub-surface sub-grade materials. Each of the test boring locations were advanced to a depth of twenty feet (20'-0") below the existing site grade. The soil boring locations can be identified on the enclosed diagram.

Soil descriptions and depths shown on the soil boring logs were approximate indications of changes from one soil to another and are not intended to represent an exact geological change or stratification.

Ground water was encountered in some of the test boring locations at the following depths:

Test boring #1 – None
Test boring #2 – None
Test boring #3 – 18'-6" below the existing site grade.
Test boring #4 – 19'-0" below the existing site grade.
Test boring #5 – 19'-0" below the existing site grade.

It should be noted that short-term ground water observations may not provide a reliable indication of the depth of the water table. In cohesive soils this is due to the slow rate of water infiltration into the bore hole as well as the potential for water to be trapped in overlying layers of granular soil in periods of heavy rain fall.

Information obtained from soil blow counts (standard penetration) indicate that the soils are variably compacted. The encountered granular soils were generally in a medium dense state, and the encountered cohesive soils generally had medium stiff to very stiff consistencies.

FAX (517) 546-1478

HASTINGS TESTING ENGINEERS
AND ENVIRONMENTAL INC.
"Testing to keep America on a firm foundation"
4841 GOLF CLUB ROAD • HOWELL, MI 48843

Soil blow counts, profiles and the unconfined compressive strengths of the encountered sub-grade soils can be reviewed on the test boring logs.

Site Preparation

It is anticipated that there will be a minimal amount of fill material required for the site. Prior to the construction of footings or slabs all organic soils or unsuitable fill materials should be removed and it is recommended that the existing sub-grade be uniformly compacted to a minimum density of ninety-five percent of the materials maximum unit weight with a 20 ton vibratory roller. Engineered fill materials could then be placed in horizontal lifts not exceeding one foot in depth with each lift compacted uniformly to a minimum density of ninety-five percent of the materials maximum unit weight as determined by AASHTO T-180 or ASTM D1557. It is anticipated that the granular sub grade soils could be used as engineered fill materials in areas where an MDOT class III granular material is suitable. If any of the on-site cohesive material is re-used as an engineered fill material it is recommended that the material be compacted with a padfoot (sheepsfoot) roller. Hastings Testing Engineers and Environmental Inc. should be on site during excavating and filling operations to verify the suitability of the native sub-grade and proposed engineered fill materials. It is recommended that all existing sub-grade soils be proof rolled with a fully loaded tandem axle dump truck or other approved equipment to determine if there is any sub-grade instability. Any unstable sub-grade materials should be removed and replaced with engineered fill material as described above.

Site Utilities

Temporary excavations for site utilities shallower than twelve feet should be able to use typical benched excavations at a 1.5:1 slope. For site utilities deeper than twelve feet it is recommended that a protective system be utilized such as trench boxes or shoring. The excavating contractor should be prepared for the potential of encountering perched ground water. Any ground water encountered at depths less than nineteen feet should be able to be removed with typical 2" pumps. Special dewatering techniques may be required for utilities placed deeper than the anticipated ground water elevation of approximately nineteen feet (19'-0) below the existing site grade. All temporary excavations should be performed according to OSHA standards and specifications.

The existing granular sub-grade materials could be suitable for backfilling utility trenches where a MDOT Class III granular material is required. The excavating contractor should be prepared to import material for utility trenches requiring MDOT class II granular material.

Foundation Recommendation

Based on the project information provided (one story building with slab on grade) and the results of field tests, it is believed that the proposed structure can be supported with conventional spread or strip footings. Prior to the construction of footings or floor slabs all organic soil and unsuitable fill materials should be removed and replaced with engineered fill materials as described in the site preparation portion of the report.

Footings could then be proportioned for a design soil pressure of two thousand pounds per square foot between one foot (1'-0") and ten feet (10'-0") below the existing site grade. Care should be taken to either remove or re-compact any loose granular or cohesive soils found in the bottom of the footing sub-grade locations. All exterior footings should be constructed at or below the maximum frost penetration of three feet six inches (3'-6") below finished grade. All footings and slabs should be constructed on naturally occurring sub-soils or engineered fill materials.

Floor Slab Recommendation

It is recommended that a minimum of six inches of clean coarse granular soil (MDOT class II granular material) be placed under all concrete slabs to provide a capillary break for any moisture migration. It is also recommended that a minimum 10 mil vapor barrier be installed directly under the concrete slab.

Expected Settlement

It is estimated that a properly configured shallow foundation constructed on the naturally occurring sub-grade soil or engineered fill material will have less than one inch of settlement and less than one-half inch of differential settlement.

Seismic Site Class

The known properties of the soils at the site are limited to the explored depths of the borings (20 feet) performed for this evaluation. Based on the conditions encountered in the borings, seismic site Class D applies to this site in accordance with the IBC and Michigan Building Code. The potential for liquefaction of the sub-grade soils should be considered low.

Detention Basin Infiltration

Test boring location #1 and #5 were drilled in the influence of the proposed underground detention system. Hastings Testing Engineers and Environmental Inc. was requested to perform permeability tests from soil sampled during drilling operations. The permeability tests were performed to determine the hydraulic conductivity of existing soils in the influence of the proposed detention pond.

Conclusion

Experience indicates that the actual subsoil conditions at the site could vary from those generalized on the basis of the test borings made at specific locations. It is therefore essential that Hastings Testing Engineers and Environmental Inc. be notified of any variation of the soil conditions to determine the effects on the recommendations in this report. The evaluations and recommendations contained in the report have been formulated on assumed data relating to the proposed project. Any significant change in this data in the final design plans should be brought to our attention for review and evaluation.
